PROFILE

Backend engineer working mostly on payments and fintech. I'm in my final year of Systems Engineering at the University of Lagos, graduating in September 2027, and I currently lead backend development at NePay, a Nigerian wallet product. Before that I led backend engineering at Grup Limited. I write TypeScript (NestJS, Express) and Java (Spring Boot) against PostgreSQL and MongoDB, and I have integrated Paystack, Flutterwave and a range of KYC, payout and crypto payment providers. I like to write the rules down before the code, and I test against how providers actually behave, not just what their docs say.

SKILLS

Languages: TypeScript, JavaScript, Java, Python, SQL, C++

Backend: NestJS, Node.js, Express, Spring Boot, Hibernate, REST APIs, Socket.io, BullMQ, modular monolith design

Databases: PostgreSQL, MongoDB, Redis, Oracle, query tuning, caching

Payments: Paystack, Flutterwave, KYC and BVN verification, virtual accounts, payouts, crypto deposits, bill payments, ledger design, idempotency, reconciliation, webhook security

Security: JWT, TOTP two factor authentication, role based access control, OWASP basics

Frontend: Next.js 15, React, Vite, responsive UI

Embedded and IoT: ESP32, smart home automation, device integration

Tools: Git, GitHub, Docker, CI/CD, Render, Vercel, Expo, Claude Code, Cline

EXPERIENCE

Backend Lead and Product Owner | **NePay**

Aug 2026 – Present

Nigerian digital wallet. NestJS, TypeScript, PostgreSQL, Next.js

- Own the backend and the product decisions, and set the API contracts with the frontend engineer.
- Designed a modular NestJS and TypeScript backend on PostgreSQL where each module stays independent, so any part can later be split into its own service without a rewrite.
- Built the wallet and ledger core. Balances only change through recorded entries, every money movement is idempotent so retries and duplicate webhooks can never credit twice, and failed transfers are reversed automatically with a traceable counter entry.
- Integrated several third party providers covering BVN identity checks, bank account issuing, payouts, crypto deposits and bill payments. Each one sits behind its own adapter, so a provider can be replaced without touching wallet logic.
- Handled the provider behaviour the docs leave out: status requery for payments that report success before they settle, reconciliation for deposits that arrive in one currency and settle in another, and batched pricing calls to stay inside rate limits.
- Made exchange rate handling fail closed, so a missing or stale rate pauses the affected features and raises an alert instead of pricing anything wrong.
- Secured the platform with TOTP two factor login using single use tokens, signature checks on every incoming webhook, secure by default route guards, and admin permissions defined once and shared by frontend and backend.
- Tested every provider against its real sandbox before trusting it and switched vendors when one proved unreliable. Features ship behind hundreds of automated tests and a live verification script run against real endpoints.
- Built and maintain the admin panel in Next.js, with dashboards, alerts and review queues for the operations team.

Systems Engineering Intern (SIWES) | Albertronics

Apr 2026 – Sep 2026

Industrial training placement. Smart home automation and embedded systems

- Worked on smart home automation, covering embedded system design and integrating devices into home control setups.
- Built the company website in Next.js, combining the online store with its smart home services.
- Added live order updates for admins over Socket.io and customer notifications through the WhatsApp Business Cloud API.

Lead Backend Engineer | Grup Limited

Feb 2025 – Jan 2026

Group buying platform, grup.com.ng

- Led backend development, from API design through to deployment.
- Built and maintained the REST APIs used by the web and mobile apps.
- Set up JWT authentication, role based access control and the payment integration.
- Kept uptime above 99.9% using caching, query tuning and monitoring.
- Handled releases and fixes across development, staging and production, and wrote technical documentation and reports for management.

Web Developer | Phlames Fashion Stores

Feb 2024 – Apr 2024

- Built and maintained backend services in Java, Spring Boot and Hibernate, with REST APIs for the storefront.
- Connected payment gateways and social platforms, and sped up page loads through database tuning and unit tests.

Backend Development Intern | PIPELINE

Oct 2023 – Nov 2023

- Debugged Spring Boot and Hibernate services and cut downtime by 10%.
- Wrote SQL scripts for database maintenance and helped with frontend integration.

PROJECTS

Promo Video Pipeline | NePay

- Node.js script that stitches AI generated clips together with ffmpeg and adds caption overlays.

Real Time Chat Room | Personal

- Chat app supporting 50 users at once with profile picture updates, hosted on Render.

EDUCATION

B.Sc. Systems Engineering | University of Lagos, Akoka

Expected Sep 2027

Coursework: Systems Simulation, Queuing Theory, Numerical Methods, Engineering Statistics, Embedded Systems, Mechatronics, Python, C++

ACWD Pro, Responsive Web Development and Integration | Aptech Computer Training**Full Stack Software Development | Power Learn Project**
